

Add a node

If you want to add a new node to your cluster, you can:

1. Click on the **Add Node** button in the top-right corner of your cluster page.
2. Alternatively, in the **Overview** tab, click on **Add Node**.

A prompt will appear, asking for confirmation to add a new node.

Add new node ✕

Do you really want to Add new Node ?

You are about to add a new node to the cluster **mysql-cluster**. Please click **Continue** to choose the cluster provider, cloud region, and service plan.

If you confirm, you will be redirected to a new page to choose your **Cloud Provider** and **Service Plan**. Once selected, click the **Create Node** button to proceed.

Since this node is part of an existing cluster, you cannot choose a custom name. The node's name will automatically follow the naming convention, incrementing the node number, even if a previous node has been deleted. For example:

- `mysql-cluster1`
- `mysql-cluster2`
- `mysql-cluster4` (if `mysql-cluster3` was deleted previously).

Once the new node is deployed, it will be automatically synchronized with the primary node and will receive all the data from it.
