

Connecting with Java

This guide shows how to connect your Java app to a **Hydra database** using the [PostgreSQL JDBC driver](#), parse command-line arguments, and run a basic query.

Variables

To connect to a Hydra database, the following parameters are required. You can find these details in the **Elestio service overview page** of your Hydra service.

Variable	Description	Purpose
<code>USER</code>	Hydra (PostgreSQL) username	Identifies the database user with access privileges
<code>PASSWORD</code>	Hydra password	Authenticates the user against the Hydra database
<code>HOST</code>	Hostname of the Hydra instance	Specifies the server address of the database
<code>PORT</code>	Port for Hydra (usually 5432)	Specifies the network port for connections
<code>DATABASE</code>	Name of the Hydra database	Specifies which database to access

These values can usually be found in the Elestio service overview details as shown in the image below, make sure to take a copy of these details and add it to the code moving ahead.

hydra-y2e0a

Hydra Cluster Running

Open terminal Delete cluster Add node

Overview Nodes Backups Audit

Termination protection Disabled. VM can be powered off and terminated. Protection deactivated

Auto-Failover Enabled. In case of failure, the cluster will automatically attempt to recover. Auto-Failover activated

Node 1 Primary Node

Database Admin Display your database credentials

Host	hydra-y2e0a-u7774.vm.elestialio.app	<input type="button" value="Copy"/>
Port	15432	<input type="button" value="Copy"/>
User	postgres	<input type="button" value="Copy"/>
Password	*****	Show password <input type="button" value="Copy"/>
CLI	PGPASSWORD=***** psql --host=hydra-y2e0a-u7774.vm.elestialio.app --port=15432 --username=postgres	Show password <input type="button" value="Copy"/>

Prerequisites

Install Java & JDBC driver

Check if Java is installed by running:

```
java -version
```

If not installed, install it first and then download and install **JDBC** driver from <https://jdbc.postgresql.org/download/> or if you have Maven installed, run the following command with updated version of the driver:

```
mvn org.apache.maven.plugins:maven-dependency-plugin:2.8:get \
-Dartifact=org.postgresql:postgresql:42.7.5:jar \
-Ddest=postgresql-42.7.5.jar
```

Code

Once all prerequisites are set up, create a new file named `HydraPg.java` and add the following code:

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.SQLException;
import java.sql.Statement;
import java.util.HashMap;
import java.util.Map;

public class HydraPg {

    static class Config {
        String host, port, database, username, password;

        Config(String host, String port, String database, String username, String password) {
            this.host = host;
            this.port = port;
            this.database = database;
            this.username = username;
            this.password = password;
        }

        String getJdbcUrl() {
            return String.format("jdbc:postgresql://%s:%s/%s?sslmode=require", host, port,
database);
        }

        boolean isComplete() {
            return host != null && port != null && database != null && username != null &&
password != null;
        }
    }

    static Map<String, String> parseArgs(String[] args) {
        Map<String, String> map = new HashMap<>();
        for (int i = 0; i < args.length - 1; i += 2) {
            map.put(args[i], args[i + 1]);
        }
    }
}
```

```

        return map;
    }

    public static void main(String[] args) {
        try {
            Class.forName("org.postgresql.Driver");

            Map<String, String> argMap = parseArgs(args);
            Config cfg = new Config(
                argMap.get("-host"),
                argMap.get("-port"),
                argMap.get("-database"),
                argMap.get("-username"),
                argMap.get("-password")
            );

            if (!cfg.isComplete()) {
                System.err.println("Missing required arguments. Example usage:");
                System.err.println("java -cp postgresql-42.7.5.jar:. HydraPg -host <HOST> -
port <PORT> -database <DB> -username <USER> -password <PASS>");
                return;
            }

            try (Connection conn = DriverManager.getConnection(cfg.getJdbcUrl(), cfg.username,
cfg.password)) {
                System.out.println("Connected to Hydra database successfully.");

                Statement stmt = conn.createStatement();
                ResultSet rs = stmt.executeQuery("SELECT current_database(), current_user,
version()");

                while (rs.next()) {
                    System.out.println("Database: " + rs.getString(1));
                    System.out.println("User: " + rs.getString(2));
                    System.out.println("Version: " + rs.getString(3));
                }

                rs.close();
                stmt.close();
            }
        }
    }
}

```

```
    } catch (ClassNotFoundException e) {
        System.err.println("PostgreSQL JDBC driver not found.");
        e.printStackTrace();
    } catch (SQLException e) {
        System.err.println("Connection or query error:");
        e.printStackTrace();
    }
}
}
```

To execute the script, open the terminal or command prompt and navigate to the directory where `HydraPg.java`. Once in the correct directory, run the script with the command (Update the variables with actual values acquired from previous steps).

```
javac HydraPg.java
```

```
java -cp postgresql-42.7.5.jar:. HydraPg -host HOST -port PORT -database DATABASE -username
USERNAME -password PASSWORD
```

If the connection is successful, the terminal will display output similar to:

```
Connected to Hydra database successfully.
Database: elestio
User: postgres
Version: PostgreSQL 14.13 (Debian 14.13-1.pgdg120+1) on x86_64-pc-linux-gnu, compiled by gcc
(Debian 12.2.0-14) 12.2.0, 64-bit
```
