

IP rate limiter

From the Dashboard, click on *Security* then Rate Limiter > *Show Options*.

From here, you can easily modify and adjust your service's rate limiter configurations, by amount and per minute or second, per IP address.

By default, all services are preconfigured with a rate limiter of 150 requests per minute and per IP address.

Rate limiter is used only for web traffic.

The screenshot shows the configuration page for a Redis service named 'redis-bgrkj'. At the top, there are icons for Redis and a 'Running' status indicator. Action buttons include 'Open terminal', 'Delete service', and 'Clone this service'. A navigation bar contains tabs for Overview, Tools, Backups, Metrics, Logs, Audit, Security (selected), Alerts, and Notes. The 'Enable/Disable Firewall' section has a warning icon and text 'Disable firewall will delete existing rules', with buttons for 'Disable Firewall' and 'Show Setting'. The 'Rate Limiter' section has a 'Hide Options' button. The main configuration area shows 'Limit request' set to '500 per minute per IP', with a 'Save' button below.
