

Alerts

Alerts are enabled by default on all new services.

You can enable or completely disable alerts. You can also configure usage limits per resource.

The default cycle duration is 1 minute and you can configure a number of cycles above the limit before sending an alert.

Alerts are sent via email to the server owner's email address on file.

The screenshot shows the configuration page for a Redis service named 'redis-bgrkj'. The service is currently 'Running'. The 'Alerts' tab is selected in the navigation menu. The 'Configure Alerts' section includes a warning: 'Disable Alerts will delete existing configuration' and a 'Disable alerts' button. Below this, the 'Configure alert cycle duration' is set to '1 Minute', with 'View current status' and 'Apply Changes' buttons. A table lists various system parameters with their respective thresholds and the number of cycles before an alert is triggered. Each row has an 'Edit' icon.

Parameter	Threshold	# of Cycles	Edit
CPU	90%	15	
Memory	90%	15	
Swap	75%	15	
Space	80%	15	
Inode	80%	15	
Read Rate	20MB/s	15	
Write Rate	20MB/s	15	
Saturation	90%	15	
Download	25MB/s	15	
Upload	25MB/s	15
