

Resync

After cloning a service, you will have a new option visible in the service overview: Resync

From the service overview, click on "Resync" button to resynchronize your cloned service from the origin. After a confirmation, the process will start and will do:

- Create a new backup from the origin
- Stop your app in the destination server
- Restore the latest fresh backup
- Restart the service

This includes the docker-compose stack, the .env, credentials, volumes. But global settings changes like custom backup configuration, custom alerts rules and custom firewall rules are not copied in this process.
